Agile Project Management MAD 501

20 September 2021

<div align="center">What would you do better?</div>

In my last semester, I had done one project on Web Usability. In the project, I had to do research about the company and design the front page on the wireframe. First, I had to step up the sign-up and login page where users can create an account and login in. After that, I had started to design the login and sign-up pages where I created username and password set up. I took some help from my instructor for built the wireframe. We had created an online meeting on the Microsoft Team which is one of the best tools to do the project.

For this project, I used the traditional approach of Project Management which is common. I have planned some of the design and discuss with my instructor and follow the step. This method is cheap and easy to use but it is not as effective as the other professional project management tool like Agile Project Management. This method does not connect the customer and could not understand the thought and ideas of the client.

If I get the same project today I will do it better way. First, I have created a group where I meet and collaborate with the client and other team members and we will get the best result. The traditional method for the project is one of the easy methods which can understand easily and safely but there are some drawbacks of the method. The method did not collaborate with many members, it does not have proper schedule planning, team meeting, and group discussion features. It has limited features and functions which are not helpful for big and standard projects. Overall, the traditional project management is limited to the small and beginner level project but it couldn't fit for the big and industrial projects.
